

# Week 1: AI Workflow Map

**Name:** Divine Ushie

**Niche:** E - Marketplace

## Project idea

MVPH is an online marketplace for phones, laptops, accessories and gadgets where customers compare products, filter by what they need, and buy with a simple checkout.

## 5-stage tool map

| # | Stage     | Tool           | Why                                                                                                                                                         |
|---|-----------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | Structure | Relume         | Generates a sitemap and wireframe sections from a short prompt, so all pages (Home, Category, Product, Compare, Cart) are planned before any design starts. |
| 2 | Concept   | Claude + Figma | Claude drafts copy, filter logic and layout ideas. Figma turns them into the visual direction: colors, typography, product-card and filter styles.          |
| 3 | Prototype | Figma Make     | Converts the concept into a clickable prototype so the browse, filter and checkout flow can be tested before building.                                      |
| 4 | Publish   | Vercel         | Puts the project on a live link that can be shared to collect feedback.                                                                                     |

| # | Stage           | Tool                      | Why                                                                                                                |
|---|-----------------|---------------------------|--------------------------------------------------------------------------------------------------------------------|
| 5 | <b>Full app</b> | <b>Lovable + Supabase</b> | Adds real functionality behind the design: product catalog with filtering, cart, user accounts and order handling. |
